

Definition (Monoidal category). A *monoidal structure* on a category \mathbf{C} consists of:

1. An object $\mathbf{1} \in \mathbf{Ob}_{\mathbf{C}}$ called the *monoidal unit*.
2. A functor $\otimes : \mathbf{C} \times \mathbf{C} \rightarrow \mathbf{C}$, called the *monoidal product*.

The two constituents are subject to the natural isomorphisms:

- a) (Left unitor) $\text{lu}_X : \mathbf{1} \otimes X \xrightarrow{\cong} X$ for every $X \in \mathbf{Ob}_{\mathbf{C}}$,
- b) (Right unitor) $\text{ru}_X : X \otimes \mathbf{1} \xrightarrow{\cong} X$ for every $X \in \mathbf{Ob}_{\mathbf{C}}$,
- c) (Associator) $\text{as}_{X,Y,Z} : (X \otimes Y) \otimes Z \xrightarrow{\cong} X \otimes (Y \otimes Z)$ for every $X, Y, Z \in \mathbf{Ob}_{\mathbf{C}}$.

These isomorphisms are themselves required to satisfy the triangle identity

$$\begin{array}{ccc}
 (X \otimes \mathbf{1}) \otimes Y & \xrightarrow{\text{as}_{X,\mathbf{1},Y}} & X \otimes (\mathbf{1} \otimes Y) \\
 \searrow \text{ru}_X \otimes \mathbf{1} & & \swarrow \mathbf{1} \otimes \text{lu}_Y \\
 & X \otimes Y &
 \end{array}$$

and the pentagon identity

$$\begin{array}{ccccc}
 & & (X \otimes Y) \otimes (Z \otimes W) & & \\
 & \nearrow \text{as}_{X \otimes Y, Z, W} & & \searrow \text{as}_{X, Y, Z \otimes W} & \\
 ((X \otimes Y) \otimes Z) \otimes W & & & & (X \otimes (Y \otimes (Z \otimes W))) \\
 \downarrow \text{as}_{X,Y,Z} \otimes \text{Id}_W & & & & \uparrow \text{Id}_X \otimes \text{as}_{Y,Z,W} \\
 (X \otimes (Y \otimes Z)) \otimes W & \xrightarrow{\text{as}_{X,Y \otimes Z, W}} & & & X \otimes ((Y \otimes Z) \otimes W)
 \end{array}$$

for $X, Y, Z, W \in \mathbf{Ob}_{\mathbf{C}}$. A category equipped with a monoidal structure is called a *monoidal category*. If the isomorphisms in a), b), and c) are equivalences, one calls the category *strict monoidal*.
