Definition (\mathcal{U} monad). The \mathcal{U} monad on **Pos** consists of:

- 1. The U endofunctor (??).
- 2. The unit natural transformation $\operatorname{un}_{\mathcal{U}} : \operatorname{Id}_{\operatorname{Pos}} \Rightarrow U$, which associates to every object $P \in \operatorname{Ob}_{\operatorname{Pos}}$ a morphisms in Pos given by:

$$\operatorname{un}_{\mathcal{U}}^{P}: P \to \mathcal{U}P$$

$$p \mapsto \uparrow \{p\}.$$

3. The compositiona natural transformation $\text{mu}_{\mathcal{U}}: U \ \ U \ \Rightarrow U$, which associates to every $P \in \text{Ob}_{\textbf{Pos}}$ the morphism in **Pos** given by:

$$\operatorname{mu}_{\mathcal{U}}^{P}: \mathcal{U}(\mathcal{U}P) \to \mathcal{U}P$$

$$P'' \mapsto \bigcup_{\mathcal{D}' \in \mathcal{D}''} P'.$$
