**Definition** (Intersection of DPIs). Given two DPIs with same functionality and resources  $\mathbf{f} = \langle \mathbf{F}, \mathbf{R}, \mathbf{I}_1, \mathsf{prov}_1, \mathsf{req}_1 \rangle$  and  $\mathbf{g} = \langle \mathbf{F}, \mathbf{R}, \mathbf{I}_2, \mathsf{prov}_2, \mathsf{req}_2 \rangle$ , define their intersection as

$$\mathbf{f} \sqcap \mathbf{g} := \langle \mathbf{F}, \mathbf{R}, \mathbf{I}_1 \cap \mathbf{I}_2, \text{prov}, \text{req} \rangle$$

where

$$\operatorname{prov}_{1}(i), \quad \operatorname{if}_{i} \in \mathbf{I}_{1} \cap \mathbf{I}_{2} \text{ and } \operatorname{prov}_{1}(i) \leq \operatorname{prov}_{2}(i)$$
 
$$\operatorname{prov}_{2}(i), \quad \operatorname{if}_{i} \in \mathbf{I}_{1} \cap \mathbf{I}_{2} \text{ and } \operatorname{prov}_{2}(i) \leq \operatorname{prov}_{1}(i) \quad (0.1)$$
 
$$\perp_{\mathbf{F}}, \quad \text{else.}$$
 
$$\operatorname{req}_{1}(i), \quad \operatorname{if}_{i} \in \mathbf{I}_{1} \cap \mathbf{I}_{2} \text{ and } \operatorname{req}_{1}(i) \geq \operatorname{req}_{2}(i)$$
 
$$\operatorname{req}_{2}(i), \quad \operatorname{if}_{i} \in \mathbf{I}_{1} \cap \mathbf{I}_{2} \text{ and } \operatorname{req}_{2}(i) \geq \operatorname{req}_{1}(i)$$
 
$$\top_{\mathbf{R}}, \quad \text{else.}$$
