Definition (Cartesian product of categories)

Given two categories $\bf C$ and $\bf D$, their *cartesian product* $\bf C \times \bf D$ is the category specified as follows:

- 1. Objects: Objects are pairs (X, Y), with $X \in Ob_{\mathbb{C}}$ and $Y \in Ob_{\mathbb{D}}$.
- 2. *Morphisms*: Morphisms are pairs of morphisms $\langle f, g \rangle : \langle X, Z \rangle \to \langle Y, U \rangle$, with $f: X \to_{\mathbf{C}} Y, g: Z \to_{\mathbf{D}} U$.
- 3. *Identity morphisms*: Given objects $X \in \mathrm{Ob}_{\mathbf{C}}$ and $Y \in \mathrm{Ob}_{\mathbf{D}}$, the identity morphism on $\langle X, Y \rangle$ is the pair $\langle \mathrm{Id}_X, \mathrm{Id}_Y \rangle$.
- 4. *Composition of morphisms*: The composition of morphisms is given by composing each component of the pair separately:

$$\langle f, g \rangle_{\mathcal{C} \times \mathbf{D}}^{\circ} \langle h, i \rangle = \langle f \rangle_{\mathbf{C}}^{\circ} h, g \rangle_{\mathbf{D}}^{\circ} i \rangle.$$
