## **Definition (Berg)**

Let **Berg** be the category defined as follows:

- $\triangleright$  Objects are tuples  $\langle p, v \rangle$ , where
  - $p \in L$ ,
  - $v \in \mathbb{R}^3$  (we think of this as a tangent vector to L at p).
- $ightharpoonup A morphism \langle p_1, v_1 \rangle \rightarrow \langle p_2, v_2 \rangle \text{ is } \langle \gamma, T \rangle, \text{ where }$ 
  - $T \in \mathbb{R}_{>0}$ ,
  - $\gamma: [0,T] \to L$  is a  $C^1$  function with  $\gamma(0) = p_1$  and  $\gamma(T) = p_2$ , as well as  $\dot{\gamma}(0) = v_1$  and  $\dot{\gamma}(T) = v_2$  (we take one-sided derivatives at the boundaries).
- For any object  $\langle p, v \rangle$ , we define its identity morphism  $\mathrm{Id}_{\langle p, v \rangle} = \langle \gamma, 0 \rangle$  formally: its path  $\gamma$  is defined on the closed interval [0, 0], (with T = 0 and  $\gamma(0) = p$ ). We declare this path to be  $C^1$  by convention, and declare its derivative at 0 to be v.
- ⊳ Given morphisms  $\langle \gamma_1, T_1 \rangle$  :  $\langle p_1, v_1 \rangle \rightarrow \langle p_2, v_2 \rangle$  and  $\langle \gamma_2, T_2 \rangle$  :  $\langle p_2, v_2 \rangle \rightarrow \langle p_3, v_3 \rangle$ , their composition is  $\langle \gamma, T \rangle$  with  $T = T_1 + T_2$  and

$$\gamma(t) = \begin{cases} \gamma_1(t) & 0 \le t \le T_1 \\ \gamma_2(t - T_1) & T_1 \le t \le T_1 + T_2. \end{cases}$$
