## **Definition** (Semicategory)

A semicategory **C** is specified by:

## Constituents

- 1. Objects: A collection  $Ob_{\mathbf{C}}$  whose elements are called *objects*.
- 2. Morphisms: For every pair of objects X, Y in  $\mathsf{Ob}_{\mathbb{C}}$ , there is a set  $\mathsf{Hom}_{\mathbb{C}}(X;Y)$ , elements of which are called *morphisms*. We write

$$f: X \rightarrow_{\mathbf{C}} Y$$

to indicate

$$f \in \operatorname{Hom}_{\mathbf{C}}(X; Y)$$
.

3. Composition operations: For every three objects X, Y, Z in  $Ob_{\mathbb{C}}$  there is a composition map

$$\S_{X,Y,Z}$$
:  $\operatorname{Hom}_{\mathbf{C}}(X;Y) \times \operatorname{Hom}_{\mathbf{C}}(Y;Z) \to \operatorname{Hom}_{\mathbf{C}}(X;Z)$ .

We usually just write  $\S$  instead of  $\S_{X,Y,Z}$ :

$$\begin{array}{cccc}
f: X \to Y & g: Y \to Z \\
\hline
f \circ g: X \to Z
\end{array}$$

## Conditions

1. Associativity: it holds that

$$f: X \to Y \quad g: Y \to Z \quad h: Z \to U$$

$$(f \ g) \ h = f \ g(g \ h)$$
