## **Definition** (Sum of resources)

If the poset  $\mathbf{P}$  is monoidal with monoidal product  $\otimes$ , then the "sum" of n copies of  $\mathbf{P}$  is a design problem given by

$$\Sigma^n: (\mathbf{P}^n)^{\mathrm{op}} \times \mathbf{P} \longrightarrow_{\mathbf{Pos}} \mathbf{Bool},$$
 
$$\langle \langle p_1, \dots, p_n \rangle^*, \mathbf{q} \rangle \longmapsto (p_1 \otimes \dots \otimes p_n \leq_{\mathbf{P}} \mathbf{q}).$$

Clearly  $\Sigma^n$  is monotone. Diagrammatically:
