**Definition** (Identity morphism). Let **S** be a semigroup. The identity function  $Id_S: S \to S$  is always a morphism of semigroups. We can easily check that **??** is satisfied:

 $\operatorname{Id}_{\mathbf{S}}(x \, \, _{\mathbf{S}}^{\circ} \, y) \, = \, x \, _{\mathbf{S}}^{\circ} \, y \, = \, \operatorname{Id}_{\mathbf{S}}(x) \, _{\mathbf{S}}^{\circ} \, \operatorname{Id}_{\mathbf{S}}(y).$ 

We call this the *identity morphism* of **S**.
