**Definition** (Functor composition). Consider categories A, B, C and functors  $F: A \rightarrow B$ **B**,  $G: \mathbf{B} \to \mathbf{C}$ . Functor composition is given by  $F : G: \mathbf{A} \to \mathbf{C}$ , where:  $\triangleright$  Given  $X \in Ob_{\Delta}$ , one has  $(F \, \, \, \, \, G)(X) := G(F(X));$ 

 $\triangleright$  Given  $f \in \operatorname{Hom}_{\Delta}(X; Y)$ , one has  $(F \, \S \, G)(f) := G(F(f))$ .
