**Definition** (loop). Suppose dp is a DPI with factored functionality space  $\mathbf{F}_1 \times \mathbf{R}$ :

$$dp = \langle \mathbf{F}_1 \times \mathbf{R}, \mathbf{R}, \mathbf{I}, \langle \mathsf{prov}_1, \mathsf{prov}_2 \rangle, \mathsf{req} \rangle.$$

Then we can define the DPI loop(dp) as

$$loop(dp) := \langle \mathbf{F}_1, \mathbf{R}, \mathbf{I}', prov_1, req \rangle,$$

where  $I' \subseteq I$  limits the implementations to those that respect the additional constraint  $req(i) \le prov_2(i)$ :

$$I' = \{i \in I : req(i) \leq prov_2(i)\}.$$

This is equivalent to "closing a loop" around dp with the constraint  $f_2 \ge r$  (??).
